

1.What are my core values and beliefs

I love learning new things and facing challenges with a positive mind set. Working together with others is important I think. Paying attention to details, making things user-friendly, and coding ethically matter to me. I always try to keep up with the changes in technology.

2.What are my goals and aspirations

My main goal and aspiration is to get really good at programming. I want to learn and improve a lot so that I can help my own self and my family also. My plan is to use my skills to create cool things in the tech world. I believe that by working hard and learning all the time, I can make a positive difference in both my career and my family's life. In Sha Allah one day I will reach my goal.

3.What are the first steps I will take to build my personal brand?

To start building my personal brand, I'll first focus on sharing what I'm good at. I'll create a portfolio and will create a linked-in profile and showcase my skills and projects. I think Connecting with others in this field, learning from them, and sharing my own experiences with them will be helpful for me. I'll work on being online in a good way and keep showing what I can do regularly

4.What are the difference between Personal Branding and Self-Promotion

Personal branding is about showing who a person is and what are his or her skills. It's like sharing ones story. Self-promotion is just talking about oneself.

It's more about being real and sharing who you are, not just trying to impress others. This matters because people like to connect with real stories, not just someone saying how great they are.

5.What am I proud of

I'm really proud that I never gave up, even when learning to code felt hard. It's like holding onto myself after every stumble, and that makes me feel really good about what I'm doing.
